

# Technical Debt

## SQUARE

Squoring Technologies delivers an innovative decision-making dashboard to manage the technical debt of software products.

**Technical Debt** refers to the cost of refactoring software to remove all defects and comply with quality requirements. It has become a widely-used performance indicator in the entire software industry.

**Monitoring software technical debt** is a key condition to maintaining a high innovation rate for all companies: the higher the debt and the corrective maintenance, the lower the innovation.

*Square brings greater productivity to our development teams.*

**Bruno Bec**, Test&Validation senior manager, Strategy & Innovation, Schneider Electric.

**Square Technical Debt** provides a fast and high return on investment by efficiently:

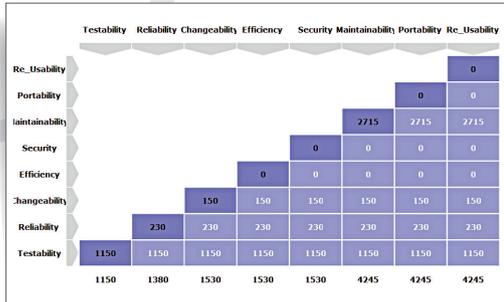

- Improving software reliability via early defect detection.
- Reducing the maintenance costs by monitoring the technical debt.
- Optimizing software project management and speeding-up decision-making.
- Promoting collaboration within project teams.
- Broadcasting best practices with a shared quality reference.
- Cutting down the costs of code review.

# Innovative features dedicated to managing your technical debt.

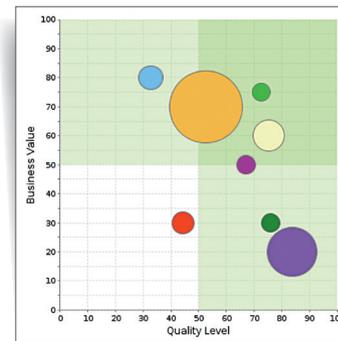

Squire implements SQALE: a standardized method for computing the technical debt

- **"Out-of-the-box" standardized control points,** metrics and rules using best industry standards, and still customizable to fit in-house practices.
- **Predefined technical debt analysis models** based on well-known methods and integrating priority criteria: risk, criticality or business value.
- **Plugins to import data from 3rd party tools** already in use: SonarQube, CheckStyle, Findbugs, JUnit, StyleCop . . .

The Squire drill-down combined with powerful filtering provides intuitive navigation in a large-sized application to spot critical or deteriorated items since previous versions

The Key Performance Indicators (Technical Debt, Business Value . . .) help tracking the respective progress and status of each project

- **Comprehensive overview of development progress** through key performance indicators and trend analysis: immediate detection of regressions, deviations from plans.
- **Unrivaled in-depth analysis** where at-risk components are immediately identified, down to the most elementary function or method.
- **Easy comparison with other similar projects** for an objective and efficient management of your project portfolio.
- **Enhanced team collaboration** achieved by centralizing all non-compliance data, automating alert notification, and sharing "to-do" lists.
- **Automatic and continuous generation of actions plans** to manage and mitigate technical debt.

## Already available

Languages > Ada / C / C++ / C# / Java / Cobol / PL/SQL / Python / ABAP / PHP . . .

Plugins for data importation > SonarQube, Findbugs, CheckStyle, PMD, JUnit, FXCop, StyleCop, Klocwork, Understand, C/C++test, Coverity, Polyspace, Logiscope, JaCoCo . . .

Integrations > Eclipse, Jenkins, CruiseControl, ClearCase, Synergy, Git, Svn, MKS . . .

Platforms > Windows, Linux.
